[Nomads](#) abound in this system which is a massive nebula cloud called the Neofelis Cloud. Profiling, from scanning Neofelis, indicated a massive nebula cloud, but tomographic imaging was unable to ascertain any details of its internal structure. In the centre of the system is a [Neutron Star](#) Radiation Field in which two Neutron Stars rotate, pilots are warned not to enter this field, if they have aspirations of living a long life. Navigation through the system is best achieved by following the old navigation buoys.

Profiling, from scanning Rebus Cloud to the north, indicated a similar result to the scan of the Neofelis Cloud, as did the scan of the Horus Cloud to the west of the system. The unfortunate pilot of the vessel Lune appears to have died trying to unravel the clouds' mysteries. The Aura Cloud to the southeast of the system consists of a large sulfur cloud containing lava asteroids. [Diamonds](#) allegedly can often be found floating freely within the cloud, but all attempts to date to obtain these [diamonds](#) have failed. No doubt that the pilot of the Monarque died, at the hands of the [Nomads](#), when trying to obtain them. The [Epsilon Indi](#) jump hole can be found, in the Aura Cloud nebula, in sector E7.
