

Hydrocarbons

Hydrocarbons are a class of organic compounds composed only of hydrogen and carbon molecules, resulting in a wide variety of substances that have important industrial applications. While [hydrocarbons](#) naturally occur in a gaseous state almost everywhere in the known universe, frozen deposits present the most easily exploited form of the substance. Hydrocarbon mining is key to the industrialization of the [Sirius Sector](#) as it provides the raw materials for the creation of the [Ship Hull Panels](#) and [Optronics](#), upon which modern society depends.
